

I have 18 years of experience as Senior Java developer /Solution Designer /Lead Developer with extensive experience in Test Driven Development and Continuous Integration /Delivery. My primary expertise lies in solutioning, designing, specifying and developing applications that are testable, manageable, scalable and maintainable using various Java application frameworks (Spring, Google Guice, Dropwizard) and architectural styles and various cloud platforms. I hold Expert member of Java Specification Request 255 – Java Management Extensions (JMX).I am always looking to improve the ways in which solutions are specified, designed and technologies are used.

Over the years I have developed various reusable frameworks for projects internally for clients from unit testing, integration testing (microservices as well as conventional web app) to various cross cutting concerns like security, traceability. Management, Compensating transaction etc.

I would like to contribute to an API that would help to improve testing and implement management and crosscutting concerns of Java applications.
