

Intel Executive Committee Position Statement – October 2021 Intel Corporation JCP Executive Committee (“EC”) positions

The JCP Executive Committee (EC) plays a significant role in the evolution of the Java platform. The vast majority of Java’s technical evolution happens in expert groups, where Java specifications are developed. The EC, by voting on JSR (“Java Specification Requests”) ballots, ensures JCP rules are consistently and fairly applied, highlighting the EC’s main role as Java’s system of governance.

Intel, in its role as a JCP EC member, has over a decade long exemplary record of consistently supporting openness and fairness, while ensuring that Java technology moves forward to address the latest trends and complex needs of future environments and platforms.

When it comes to the Java ecosystem and its future, the interests of Java Community, Java developers, and Intel are all aligned. Given that a significant population of developers, end-users and customers use Java on Intel architecture platforms, it is essential that we help move Java forward. By taking a holistic view of the platform, with both hardware and software working together to deliver the best possible solutions from client to server, Java and the Java community benefit into the future.

Intel is committed to supporting the growth and utility of Java so that each new version even better meets the needs of users and developers in our complex and challenging industry.

Given the opportunity to continue to serve on the JCP EC, Intel will continue to advocate that the JCP process remain transparent, open, and productive, while addressing the needs of all Java environments.

Sincerely,
Intel JCP EC Representative
