JSR-180 SIP API for Java ME API™ - Change Log

#	Change Description	Reason	Spec version
1	Corrections to SipProtocolPermission and SipsProtocolPermission • clearer target URI definition and implies method definition (including the wildcard mechanism) • editorial corrections	The definition for the wildcard mechanism in the permission classes is incomplete and contains errors. Copy&paste errors in the permission definition (incorrectly mentions HttpsProtocolPermission).	1.2
2	Clarification to URLs for SIP push registration The URLs defined in JSR 180 specification Appendix A, section "JSR 180 Push Registration Entry" will be allowed to include a specification for the transport protocol in the way defined in JSR 180 specification section "Supported Transport Protocols". If the transport parameter is not defined, UDP is to be assumed. This has been the intent of the specification, but has not been clearly stated.	The protocol to use when making SIP push registrations was unspecified. This clarification defines that behavior.	1.2
