JSR 352 Expert Group

Working Session
14 March 2012
Agenda

- Discussion: Parallel Annotations
- Discussion: Job Context
- List for Next Meeting
Discussio*n: Parallel Annotations

- Decide which models to support
  - Partitioned, Concurrent, Pipeline

- RI/TCK will support single JVM parallelization, but spec must accommodate multi-JVM

- Annotations must support
  - Flow control specification (i.e. which style of parallelization, which steps, etc)
  - Parallel decision/communication needs (e.g. partitioning, inter-job communication, etc)
Discussion: Parallel Annotations

First: Sequential Steps, Single JVM

Threads run a sequence of steps in a specified order.

Need a way to specify execution order
Sequential Steps, Single JVM

```java
@Job(name="Job1")
@ExecutionOrder=({'Step1','Step2'})
public class MyJob {
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
}
```
Discussion: Parallel Annotations

Partitioned Step, Single JVM

Multiple instances of Step1 started at same time on separate threads
Partitioned Step, Single JVM

```java
@Job(name="Job1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(partition=true) MyStep myStep;
}
```

Note: there will be an annotation that deals with “partitioning rules”
e.g. how many partitions, unique parameter values for each
Discussion: Parallel Annotations

Partitioned Step, Multiple JVMs

Multiple instances of Step1 started together on separate threads in different JVMs
Discussion: Parallel Annotations

Partitioned Step, Multiple JVMs

```java
@Job(name="Job1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(partition=true, jvms=JVMs.MULTIPLE)
    MyStep myStep;
}
```

Note: there will be a batch container plug-in that deals with partition distribution
Discussion: Parallel Annotations

Concurrent Steps, Single JVM

Thread1

Step1

Thread2

Step2

Step1 and Step2 started at same time on separate threads
Concurrent Steps, Single JVM

```java
@Job(name="Job1")
@ExecutionOrder=("Group1")
public class MyJob {
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
    @StepGroup(name="Group1") String[] = {"Step1","Step2"}
}
```

Presence of multiple steps requires use of @ExecutionOrder annotation.

Note: A StepGroup is concurrent steps, single JVM by default.
**Discussion: Parallel Annotations**

Concurrent Steps, Multiple JVMs

Step 1 and Step 2 started at the same time on separate threads, in different JVMs.
@Job(name="Job1")
@ExecutionOrder=( "Group1")
public class MyJob {
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
    @StepGroup(name=“Group1”)
        @Parallel(concurrent=true,jvms=JVMs.MULTIPLE)
        String[]= {“Step1”,“Step2”}
}
Discussion: Parallel Annotations

Pipeline Step, Single JVM

Thread1

@ReadItem

Thread2

@ProcessItem

ThreadN

@ProcessItem

@WriteItem

N threads

M items per write
Discussion: Parallel Annotations

Pipeline Step, Single JVM

```java
@Job(name="Job1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(pipeline=true) MyStep myStep;
}
```
Discussion: Parallel Annotations

Pipeline Step, Multiple JVMs

Thread1 \(\rightarrow\) @ReadItem

pipeline

Thread2 \(\rightarrow\) @ProcessItem

pipeline

\ldots

pipeline

Thread3 \(\rightarrow\) @ProcessItem

JVM

ThreadN \(\rightarrow\) @ProcessItem

JVM

@WriteItem
Discussion: Parallel Annotations

Pipeline Step, Multiple JVMs

```java
@Job(name="Job1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(pipeline=true, jvms=JVMs.MULTIPLE)
    MyStep myStep;
}
```
Discussion: Parallel Annotations

Partitioned Sequential Steps, Single JVM

Each threads run the same sequence of steps.
Discussion: Parallel Annotations

Partitioned Sequential Steps, Single JVM

```java
@Job(name="Job1")
@ExecutionOrder="Group1"
public class MyJob {
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
    @StepGroup(name="Group1")
        @Parallel(partition=true) String[]={"Step1","Step2"}
}
```
**Discussion: Parallel Annotations**

Partitioned Sequential Steps, Multiple JVMs

Each threads run the same sequence of steps, each sequence runs in separate JVMs.

Partitioned Sequences Step1 and Step2 are started together.
Partitioned Sequential Steps, Multiple JVMs

```java
@Job(name="Job1")
@ExecutionOrder=("Group1")
public class MyJob {
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
    @StepGroup(name="Group1")
    @Parallel(partition=true,jvms=JVMs.MULTIPLE)
    String[]={"Step1","Step2"}
}
```
Discussion: Parallel Annotations

Partitioned Step1 and Partitioned Step2 are started together.

Each partitioned step runs on its own set of threads. The number of threads per step may be different.

Partitioned Step1

- Thread 1
  - Step 1

- Thread N
  - Step 1

Partitioned Step2

- Thread N+1
  - Step 1

- Thread N+M
  - Step 2

Partitioned Step1 and Partitioned Step2 are started together.
Concurrent Partitioned Steps, Single JVM

```java
@Job(name="Job1")
@ExecutionOrder=("Group1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(partition=true) MyStep myStep;
    @Step(name="Step2")
    @Parallel(partition=true) MyOtherStep myOtherStep;
    @StepGroup(name="Group1")
    @Parallel(concurrent=true)
    String[]={"Step1","Step2"}
}
```
Each partitioned step runs on its own set of threads. The number of threads per step may be different. Threads are in different JVMs.

Partitioned Step1

Partitioned Step2

Partitioned Step1 and Partitioned Step2 are started together.
Discussion: Parallel Annotations

Concurrent Partitioned Steps, Multiple JVMs

```java
@Job(name="Job1")
@ExecutionOrder=("Group1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(partition=true,jvms=JVMs.MULTIPLE)
    MyStep myStep;
    @Step(name="Step2")
    @Parallel(partition=true,jvms=JVMs.MULTIPLE)
    MyOtherStep myOtherStep;
    @StepGroup(name="Group1")
    @Parallel(concurrent=true)
    String[]={"Step1","Step2"}
}
```
Discussion: Parallel Annotations

Partitioned Concurrent Steps, Single JVM

Each group of concurrent steps runs partitioned in the same JVM. The number of threads per step is the same.

Concurrent steps Step1, Step2  Concurrent steps Step1, Step2

Steps Step1 and Step2 are started together as a group.
Partitioned Concurrent Steps, Single JVM

```java
@Job(name="Job1")
@ExecutionOrder="Group1"
public class MyJob {
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
    @StepGroup(name="Group1")
    @Parallel(partition=true, concurrent=true)
    String[]={"Step1","Step2"}
}
```
Partitioned Concurrent Steps, Multiple JVMs

Each group of concurrent steps runs partitioned across multiple JVMs. The key requirement is same-JVM proximity for the concurrent steps, and then partitioning of each step group.

Concurrent steps Step1, Step2

Steps Step1 and Step2 are started together as a group across multiple JVMs.
Partitioned Concurrent Steps, Multiple JVMs

```java
@Job(name="Job1")
@ExecutionOrder=(“Group1”)
public class MyJob {
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
    @StepGroup(name="Group1")
    @Parallel(partition=true,concurrent=true,
        jvms=JVMs.MULTIPLE)
    String[]={“Step1”,"Step2”}
}
```
Discussion: Parallel Annotations

Partitioned pipelined Step

Multiple instances of Step1 started at the same time on separate threads
Partitioned pipelined Step

```java
@Job(name="Job1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(partition=true, pipeline=true)
    MyStep myStep;
}
```
Discussion: Parallel Annotations

Concurrent Pipelined Step

Step 1
- Thread 1
  - @ReadItem
  - Thread 2
    - @ProcessItem
    - ...
    - Thread N
      - @ProcessItem
  - @WriteItem

Step 2
- Thread 1
  - @ReadItem
- Thread 2
  - @ProcessItem
- ...
- Thread N
  - @ProcessItem
- @WriteItem
Discussion: Parallel Annotations

Concurrent Pipelined Step

```java
@Job(name="Job1")
@ExecutionOrder("Group1")
public class MyJob {
    @Step(name="Step1")
    @Parallel(pipeline=true)
    MyStep myStep;
    @Step(name="Step2")
    @Parallel(pipeline=true)
    MyOtherStep myOtherStep;
    @StepGroup(name="Group1")
    @Parallel(concurrent=true)
    String[]={"Step1","Step2"}
}
```
**Discussion: Job Context**

- **Runtime object** that communicates state of current job execution
- **Injected by Runtime via annotation**
- **Holds following information:**
  - **Job**
    - name, parameters
    - End state, return code
    - Metrics
    - Transient and persistent “properties” bags
  - **Per step**
    - Name, parameters
    - End state, return code
    - Metrics
    - Transient and persistent “properties” bags
package jsr352.example;
import javax.batch.runtime.JobContext;
@Job(name="Job1")
public class MyJob {
    @Context JobContext jobCtx;
    @Step(name="Step1") MyStep myStep;
    @BeforeJob void begin() {
        System.out.println("Job name=", jobCtx.getJobName());
    }
}
package jsr352.example;
import javax.batch.runtime.JobContext;
import javax.batch.runtime.StepContext;
@Job(name="Job1")
@ExecutionOrder(\{"Step1","Step2"\})
public class MyJob {

    @Context JobContext jobCtx;
    @Step(name="Step1") MyStep myStep;
    @Step(name="Step2") MyOtherStep myOtherStep;
    @BeforeJob void begin() {
        StepContext stepCtx= jobCtx.getCurrentStepContext();
        System.out.println("Step name=“,jobCtx.getStepName());
    }
}
List for Next Meeting

- Partition and Parallel Communication Annotations
- Future
  - Exit codes
  - Step conditions
  - Metrics
  - Java EE
